

The Library, made simple

- Find a film, Bible text, or audio recording.
- Save what you want on your phone.
- Send a saved file to another person.

The red circle on each page shows what to tap.

What is in the library?

- Films, Bible texts, spoken audio, and old scans.
- Choose English, Urdu, Sindhi, or Pashto.
- Tap a title to watch, listen, or read.

On the website, media streams over the internet. A prepared card can hold selected files for offline use.

Choose your language

- On the first screen, tap the language you want.
- You can change it later at the top of the page.

The choice also changes which language of media appears first.

Open the Library

- Tap Library at the bottom of the screen.
- The Library shows everything in your chosen language.

Use the category buttons if you want only films, audio, or Bible text.

Find something to open

- Type a name in the search box.
- Tap the matching result.

This example uses the short film “iBible: Salvation Story.”

Keep a film on your phone

- Open the film and tap Save to my phone.
- You can also watch it on this page.

The website needs an internet connection to stream or save media.

Choose the smaller video

- Tap Video — SD.
- The smaller file is easier to save and share.

In this example, SD is about 101 MB.

Save it to Downloads

- Tap Save to Downloads.
- Wait for the saving step to finish.

If your phone asks where to put the file, choose Downloads.

Find the saved file

- Open your phone's Files app.
- Look in Downloads, then tap the file.

On an iPhone, use Files. On Android, it may be called Files or My Files.

Start on both phones

- Open the same BibleTransfer123 address on both phones.
- Tap Send at the bottom. On the phone with the file, tap Send.

On the other phone, tap Receive.

Read the six-digit code

- The sending phone shows a six-digit code.
- Tell the other person that code.

The number in this picture is only an example. Yours will be different.

Connect the receiving phone

- On the other phone, tap Receive.
- Type the six digits shown on the sending phone.

Wait for the phones to connect.

Choose the file

- On the sending phone, tap Choose a file from this phone.
- Pick the file you saved earlier.

The connected device name may be different from the example shown.

Accept on the other phone

- Check the file name on the receiving phone.
- Tap Accept. Wait for the transfer to finish.

A folder choice may also appear on some devices.

Save and check the copy

- On the receiving phone, tap Save.
- Open the saved file once to check it works.

The sample file in this picture was used only to demonstrate the steps.

For other device combinations

- Open the Guide and choose the sharing instructions.
- Pick the device you are sending FROM.

The guide covers phones, computers, and a microSD card.

Choose the receiving device

- Pick the device you are sending TO.
- Follow the numbered steps the app gives you.

The example here is an iPhone sending to Android.

REMEMBER

Three useful things to remember

- A saved file stays on the phone after you leave the site.
- On the website, an internet connection is needed for streaming and pairing.
- Try one small file first, then open it on the receiving phone.

A prepared card or VillageServer can serve packed files without internet.

The LibraryEnglish

1

Understand why this one is harder

AirDrop only talks to Apple devices and Quick Share only to Android. Between the two you need something that speaks to both.

2

Best: LocalSend on both

Install LocalSend on the iPhone and the Android phone, put both on the same Wi-Fi — the VillageServer network is fine — and send. No internet, no account.

3

If you cannot install anything

Plug the iPhone into a computer, copy the file off, then plug the Android in and copy it across. Slower, but it uses nothing you have to download.

4

Or use the card itself

On a phone with a card slot or an adapter, put the file on a microSD card and move the card. This is the most reliable route with no network at all.
